▼ Question 1

Compilation: Successful

⌚ Time taken: 34m 17s

Marks Scored: 0/40

Infix to Prefix conversion

Infix Expressions:

In Infix expressions, operators are written in-between their operands.

An expression such as  $A * (B + C) / D$  means-

- 1. First add B and C together
- 2. Multiply the result by A
- 3. Divide by D to get the final answer

The expression for adding the numbers 1 and 2 is "1 + 2".

Prefix Expressions:

In Prefix expressions, operators are written before their operands.

The expression for adding the numbers 1 and 2 is "+ 1 2".

In more complex expressions, the operators still precede their operands.

For instance, the expression that would be written in conventional infix notation as -

$(5 - 6) * 7$  can be written in prefix as  $* - 5 6 7$ .

Write a program which takes string as input containing an infix expression and returns the corresponding prefix expression.

Note:

- 1. The string contains operators **(+, -, /, \*)**, parenthesis and operands **(digits)**.
- 2. Each digit is a separate operand.

The operator precedence is as follows:

- 1. **[divide(/) and multiply(\*) operator ] > [addition(+) and subtraction(-) operator ]**.
- 2. If you encounter operators with same precedence like (divide and multiply) or (addition and subtraction), then evaluate the operators from left to right.

Input Specification:

**input1:** string which contains the infix expression.

Output Specification:

Return the corresponding prefix expression.

Example 1:

**input1:** 8+(7-9)\*2

**Output:** +8\*-792

Explanation:

=> 8+(7-9)\*2

=> Reverse is: 2\*(9-7)+8

1. character: 2	stack: 2	operations: nil
2. character: *	stack: 2	operations: *
3. character: (	stack: 2	operations: *(
4. character: 9	stack: 2 9	operations: *(
5. character: -	stack: 2 9	operations: *(-
6. character: 7	stack: 2 9 7	operations: *(-
7. character: )	stack: 2 9 7 -	operations: *(-)
8. character: +	stack: 2 9 7 - *	operations: +
9. character: 8	stack: 2 9 7 - * 8 +	operations: nil

=>Reverse again: +8\*-792

Example 2:

input1: (1)+8

Output: +18

Explanation:

=>(1)+8

=> Reverse is: 8+(1)

1. character: 8	stack: 8	operations: nil
2. character: +	stack: 8	operations: +
3. character: (	stack: 8	operations: +(
4. character: 1	stack: 8 1	operations: +(
5. character: )	stack: 8 1	operations: +()

=> 81+

=>Reverse again: +18

Students Report

Given a list of N students, every student is marked for M subjects. Each student is denoted by an index value. Their teacher Ms. Margaret must ignore the marks of any 1 subject for every student. For this she decides to ignore the subject which has the lowest class average.

Your task is to help her find that subject, calculate the total marks of each student in all the other subjects and then finally return the array of the total marks scored by each student.

Input Specification:

- input1:** An integer value N denoting number of students
- input2:** An integer value M denoting number of subjects
- input3:** A 2-D integer array of size N\*M containing the marks of all students in each subject

Output Specification:

Return an integer array of size N containing the total marks of each student after deducting the score for that one subject.

Example 1:

- input1:** 3
- input2:** 5
- input3:** { {75, 76, 65, 87, 87},  
              {78, 76, 68, 56, 89},  
              {67, 87, 78, 77, 65} }

**Output:** {325, 299, 296}

Explanation:

Out of these subjects, the students' average was lowest in Subject 3 i.e.,  $65+68+78 = 211/3 = 70.3$

So, the teacher will ignore marks of this subject and will consider the total for all the other four subjects for all the three students i.e., 325, 299, 296 respectively.

Hence, {325,299,296} is returned as the final output.

Example 2:

- input1:** 3
- input2:** 3
- input3:** { {50, 30, 70},  
              {30, 70, 99},  
              {99, 20, 30} }

**Output:** {120, 129, 129}

Explanation:

Out of these subjects, the students' average was lowest in subject 2 i.e.,  $30+70+20 = 120/3 = 40$

So, the teacher will ignore marks of this subject and will consider the total for the other two subjects for each of the three students i.e., 120, 129, 129 respectively.

Hence, {120, 129, 129} is returned as the final output.

David and the Training Regimen

David has adopted a new training regimen. He will do 1, 2 and 3 units of training on the first, second and third day respectively. From the fourth day onwards, the number of units he will train will be equal to the sum of training units done on the previous 3 days. Write a function to return the number of units of training David would do on the N<sup>th</sup> day?

*Note: Since the answer can be very large, modulo it by 1000000007.*

Input Specification:

**input1:** An interger value denoting the value of N<sup>th</sup> day. (1 <= input1 <= 10<sup>9</sup>)

Output Specification:

Return the amount of training units done on the input1<sup>th</sup> day.

Example 1:

**input1:** 4

**Output:** 6

Explanation:

Given the above scenario, amount of training units done on the input1<sup>th</sup> i.e., 4th day is the sum of the training units done on the 1st, 2nd and 3rd day i.e., (1+2+3=6). Hence, 6 is returned as output.

Example 2:

**input1:** 6

**Output:** 20

Explanation:

Given the above scenario, amount of training units done on the input1<sup>th</sup> day is the sum of the training units done on the 3rd, 4th and 5th day i.e., (3+6+11=20). Hence, 20 is returned as output.

shadow: 2px 2px 2px 2px 2px 2px #ccc;		

What will be printed in the console?

```
const mObj = {
  "name": 'Baba Yaga',
  "getName": function () {
    console.log(this.name)
  }
}
console.log(JSON.stringify(mObj))
```

Response:

OPTIONS	RESPONSE	ANSWER
{"name":"Baba Yaga", "getName":"function () {console.log(this.name)}"}		
Error		
{"name":"Baba Yaga"}	✓	✓
None of the above		

The URL property belongs to which of the following object?

Response:

OPTIONS	RESPONSE	ANSWER
Document	✔	✔
Element		
Location		
Event		

What will be printed in the console?

```
const mArr = [1, 2, 3, 4, 5, 6, 7, 8, 9, 10]
mArr.slice(0, 5);
mArr.splice(2, 3);
console.log(mArr);
```

Response:

OPTIONS	RESPONSE	ANSWER
[1, 2, 6, 7, 8, 9, 10]	✔	✔
[1, 2]		
Error		
[1, 2, 6]		

A linkage of series of prototype objects is called as \_\_\_\_\_?

Response:

OPTIONS	RESPONSE	ANSWER
prototype stack		
prototype chain	✔	✔
prototype class		
prototypes		

What will be printed in the console?

console.log("This is another /'test/' string")

Response:

OPTIONS	RESPONSE	ANSWER
This is another /'test/' string		
This is another test string		
This is another 'test' string		
Error	✔	✔

What will the following function do?

```
const mFunc = (arg) => {
  if (arg !== undefined && arg !== null) {
    return Object.keys(arg).map((objKey) => {
      return (
        [...Array(arg[objKey])].map((orderItem, key) => {
          return ({
            id: arg[objKey].id,
            name: arg[objKey].name
          });
        })
      )
    }).reduce((acc, item) => {
      return acc.concat(item)
    }, []);
  } else {
    return []
  }
}
```

Response:

OPTIONS	RESPONSE	ANSWER
Takes a JSON array as an input and returns another JSON array		
Take a JSON object as an input and returns a JSON array	✔	✔
Takes a JSON object as an input and returns a JSON object		
Takes a JSON array as an input and return a JSON object		

Which statement best describes Spread and Rest operator?

Response:

OPTIONS	RESPONSE	ANSWER

Response:

OPTIONS	RESPONSE	ANSWER
event		
interface		
function	✓	✓
handler		

In the following syntax, the data type within the square brackets must be\_\_\_\_\_?

```
var mObj = {  
  name: 'Lucifer Morningstar'  
}  
mObj[key-data-type] = 28;
```

Response:

OPTIONS	RESPONSE	ANSWER
An integer		
A String	✔	✔
An object		
Floating point		

What will be printed in the console?

```
console.log(num1);  
num1 = 10;  
console.log(num1);  
var num1;
```

Response:

OPTIONS	RESPONSE	ANSWER
Error		
undefined and 10	✔	✔
undefined and undefined		
10 and 10		

What will be printed in the console?

```
const mObj = {
  "name": 'Baba Yaga',
  "getName": function () {
    console.log(this.name)
  }
}

localStorage.setItem('user-details', mObj);
console.log(localStorage.getItem('user-details'));
```

Response:

OPTIONS	RESPONSE	ANSWER
{"name":"Baba Yaga", "getName":"function () {console.log(this.name)}"}		
{"name":"Baba Yaga", "getName":[function Function]}		
{"name":"Baba Yaga"}		
[object Object]	✓	✓

What will be printed in the console?

```
console.log(undefined == null)
console.log(undefined === null)
```

Response:

OPTIONS	RESPONSE	ANSWER
true and true		
true and false	✓	✓
false and true		
false and false		

What is the observation made in the following JavaScript code?

```
var count = [1, , 3];
```

Response:

OPTIONS	RESPONSE	ANSWER
The omitted value takes “undefined”		✓
This results in an error		
This results in an exception	✓	
The omitted value takes an integer value		

What will be printed in the console?

```
console.log(parseInt("123xyz"));
```

Response:

OPTIONS	RESPONSE	ANSWER
123	✓	✓
123xyz		
Exception		
NaN		

What will be printed in the console?

```
var welcome = "Hello"  
console.log(welcome.split(""));
```

Response:

OPTIONS	RESPONSE	ANSWER
Hello		
["Hello"]		
['H', 'e', 'l', 'l', 'o']	✔	✔
None of the above		

What will be printed in the console?

```
class Person {
  constructor() {
    this.name = 'John';
    this.age = 30;
  }
  getName() {
    return this.name;
  }
}

class Athelete extends Person {
  constructor() {
    super();
    this.occupation = 'Shooter';
  }
  getDetails() {
    console.log(this.getName() + ' works as a ' + this.occupation);
  }
}

const mObj = new Athelete();
mObj.getDetails();
console.log(mObj.getName());
```

Response:

OPTIONS	RESPONSE	ANSWER
"John works as a Shooter" and "John"	✔	✔
Error		
"John works as a Shooter" and Error		
"John works as a Shooter"
